Birla Institute of Technology and Science Pilani, Dubai Campus

CS F212 – DATABASE SYSTEMS

BITS Hackathon Hub

Presented to:
Dr Shivang Agarwal

Members:
Krish Anand Anantha Natarajan -2024A7PS0282U
Prashanth Ananthakrishnan - 2024A7PS0329U

1.Problem Statement:

Modern hackathons involve large-scale coordination between participants, teams, organizers, mentors, and judges. Most college-level hackathons still rely heavily on manual coordination through spreadsheets, messaging platforms, and scattered forms, which creates inefficiencies in registration management, team formation, mentorship scheduling, project submissions, and evaluation processes.

Students often face difficulties in:

- discovering relevant hackathons,
- forming teams with compatible skill sets,
- managing registrations and submissions,
- finding mentors,
- tracking evaluations and rankings.

At the same time, organizers face challenges in:

- handling large participant datasets,
- maintaining team and registration consistency,
- managing mentor availability,
- conducting fair project evaluations,
- generating leaderboards and analytics,
- ensuring data integrity across multiple operations.

To address these issues, we developed **Hackathon Hub**, a centralized full-stack hackathon management platform that automates and streamlines the complete hackathon lifecycle.

The system provides functionalities for:

- user registration and role management,
- hackathon creation and management,
- team creation and member management,
- skill-based team matching,
- project submission tracking,
- mentor slot booking,
- evaluation and scoring,
- leaderboard generation,
- resource management.

The project focuses strongly on database design and management concepts using MySQL. The system implements:

- normalized relational database design,
- primary and foreign key relationships,
- many-to-many relationship mapping tables,
- triggers for automatic validation and synchronization,
- stored procedures for reusable business operations,
- views for simplified data access,
- indexes for query optimization.

The frontend of the system was developed using React with Vite, while the backend was implemented using Java Spring Boot. Communication between frontend and backend is handled using REST APIs, and database interaction is managed through JPA/Hibernate ORM connected to a MySQL relational database.

The primary objective of the project is to create a scalable, organized, and efficient hackathon management system while applying core DBMS concepts in a real-world application environment.

2.Technology Overview:

(i) Frontend

The frontend of the project was developed using React with Vite.

- React was used to build the user interface using reusable components such as hackathon cards, dashboards, forms, team pages, and submission pages.
- Vite was used as the frontend build tool because it provides faster development startup, efficient hot reloading, and optimized frontend performance.
- The frontend communicates with the backend using REST APIs through HTTP requests and dynamically updates the user interface using JSON responses received from the backend.

(ii) Backend

The backend of the project was developed using Java Spring Boot.

- Spring Boot was used to create REST APIs, manage backend business logic, validations, authentication handling, and server-side processing.
- JPA/Hibernate ORM was used to connect the backend with the MySQL database and automatically map Java objects to relational database tables.
- The backend handles operations such as hackathon management, team management, registrations, mentor bookings, project submissions, evaluations, and leaderboard generation.

3.List of tables:

Table	Purpose
Users	Stores all platform users including students, mentors, judges, and admins along with authentication and profile-related information
Skills	Stores the master list of technical and non-technical skills used throughout the platform
Hackathons	Stores complete hackathon information including dates, status, team size rules, organizer details, and participation limits
user_skills	Mapping table connecting users with their skills and proficiency levels
hackathon_tags	Stores searchable tags/categories associated with hackathons for filtering and discovery
Teams	Stores teams created for hackathons including leader details, team size, and recruitment status
team_members	Stores membership records of users inside teams along with member roles and participation status
team_required_skills	Stores skills that teams are looking for while recruiting members
Registrations	Stores user registrations for hackathons along with team association and registration status
submissions	Stores hackathon project submissions including repository links, demos, scores, feedback, and evaluation status
submission_tech_stack	Stores the list of technologies/frameworks used in each project submission
evaluation_criteria	Stores judging criteria and maximum score rules used during project evaluations
evaluations	Stores judge evaluations, total scores, and feedback for project submissions
evaluation_scores	Stores detailed criterion-wise scores given during project evaluations

mentors	Stores mentor-specific information such as company, designation, rating, and mentoring activity statistics
mentor_expertise	Maps mentors to their areas of technical expertise and skills
mentor_slots	Stores mentor availability slots along with booking and scheduling information
mentor_bookings	Stores mentor session bookings made by users/teams along with booking status and notes
resources	Stores useful platform resources, links, and learning/reference materials shown on the website
audit_logs	Stores system activity logs and history records for tracking important actions performed in the platform

4.Important Attributes/References:

Table	Important Attributes / References
Users	user_id (main identifier), role (controls STUDENT/MENTOR/JUDGE/ADMIN behaviour), email & username are UNIQUE, referenced by many tables
Skills	skill_id is referenced by multiple mapping tables, category ENUM organizes skills into domains
Hackathons	Central table of project. Important fields: status, registration_deadline, min_team_size, max_team_size, current_participants, organizer_id → users(user_id)
user_skills	Many-to-many mapping between users and skills, includes proficiency_level
hackathon_tags	Supports filtering/searching hackathons using tags
Teams	Important references: hackathon_id, leader_id; is_open controls recruitment; unique team name inside each hackathon
team_members	Core membership table connecting users and teams; includes status and is_leader
team_required_skills	Used for team recruitment and skill matching
Registrations	Central participation table connecting users, teams, and hackathons
Submissions	Stores project submission data; important fields: repo_url, demo_url, score, feedback, status
submission_tech_stack	Stores technologies/frameworks used in submitted projects
evaluation_criteria	Defines judging parameters and max scores for hackathons
evaluations	Stores judge evaluations; important references: submission_id, judge_id; contains total_score

`evaluation_scores`	Detailed criterion-wise marks for each evaluation; strongly normalized design
`mentors`	Extends user data into mentor-specific information like `rating`, `designation`, `company`
`mentor_expertise`	Many-to-many mapping between mentors and skills
`mentor_slots`	Scheduling/availability table for mentoring sessions
`mentor_bookings`	Stores actual mentor booking transactions and session statuses
`resources`	Simple admin-managed resource/link table with `display_order` and `is_active`
`audit_logs`	Tracks system activity/history; useful for debugging and auditing

5. Important Relationships in the Entire Schema

Relationship	Type
Users ↔ Skills	Many-to-Many (`user_skills`)
Hackathons ↔ Teams	One-to-Many
Teams ↔ Users	Many-to-Many (`team_members`)
Teams ↔ Required Skills	Many-to-Many (`team_required_skills`)
Hackathons ↔ Registrations	One-to-Many
Hackathons ↔ Submissions	One-to-Many
Submissions ↔ Evaluations	One-to-Many
Evaluations ↔ Evaluation Scores	One-to-Many
Mentors ↔ Skills	Many-to-Many (`mentor_expertise`)
Mentors ↔ Slots	One-to-Many
Mentor Slots ↔ Bookings	One-to-One-ish via UNIQUE(slot_id)

6.List of Triggers:

Trigger	Type	Detailed Purpose
`trg_hackathons_bi_validate`	BEFORE INSERT	Automatically validates newly created hackathons before insertion by checking whether the start date is before the end date and whether the registration deadline occurs before the hackathon starts. Prevents invalid scheduling data from entering the database.
`trg_hackathons_bu_validate`	BEFORE UPDATE	Validates updated hackathon details before modification and prevents administrators/users from changing an existing hackathon into an invalid state such as incorrect dates or invalid registration deadlines.
`trg_team_members_bi_validate`	BEFORE INSERT	Checks the current number of ACTIVE team members before allowing a new member to join a team. Prevents insertion when the team has already reached its maximum allowed capacity.
`trg_team_members_ai_status`	AFTER INSERT	Automatically recalculates whether a team should remain open for recruitment after a new member joins. Also inserts activity records into the `audit_logs` table for tracking team membership events and system history.
`trg_team_members_au_status`	AFTER UPDATE	Automatically recalculates the team recruitment/open status whenever a team member's status changes (for example ACTIVE → LEFT or REMOVED). Ensures the `teams.is_open` field always reflects actual available capacity.
`trg_team_members_ad_status`	AFTER DELETE	Recalculates team recruitment/open status after member deletion to ensure teams reopen automatically whenever free slots become available.

trg_registrations_bi_validate	BEFORE INSERT	Validates registration eligibility including hackathon status, registration deadlines, participant capacity, and team-hackathon consistency before allowing a registration record to be inserted.
trg_registrations_ai_count	AFTER INSERT	Automatically recalculates and updates the confirmed participant count of hackathons whenever new registrations are inserted into the system.
trg_registrations_au_count	AFTER UPDATE	Automatically recalculates participant counts for both old and updated hackathons whenever registration records are modified, cancelled, confirmed, or reassigned.
trg_registrations_ad_count	AFTER DELETE	Automatically recalculates hackathon participant counts after registration deletion to ensure confirmed participant statistics remain accurate.
trg_submissions_bi_validate	BEFORE INSERT	Validates whether a hackathon is currently accepting submissions and ensures teams can only submit projects to their own hackathon.
trg_evaluations_bi_defaults	BEFORE INSERT	Automatically assigns the current timestamp to evaluation records whenever an evaluation time is not explicitly provided during insertion.
trg_evaluation_scores_bi_validate	BEFORE INSERT	Validates criterion-wise evaluation scores before insertion and prevents judges from assigning marks outside the allowed scoring range for each evaluation criterion.
trg_evaluation_scores_bu_validate	BEFORE UPDATE	Validates updated evaluation scores before modification and prevents criterion scores from being changed to invalid values outside the allowed scoring range.

trg_evaluation_scores_ai_total	AFTER INSERT	Automatically recalculates evaluation totals, computes average submission scores across judges, and updates submission status whenever criterion-wise scores are inserted.
trg_evaluation_scores_au_total	AFTER UPDATE	Automatically recalculates evaluation totals and final submission scores whenever judges modify criterion-wise evaluation marks.
trg_evaluation_scores_ad_total	AFTER DELETE	Automatically recalculates evaluation total scores whenever criterion-wise evaluation score records are deleted from the system.
trg_mentor_bookings_bi_validate	BEFORE INSERT	Validates mentor slot availability before booking creation and automatically assigns the correct mentor ID based on the selected mentor slot.
trg_mentor_bookings_ai_slot	AFTER INSERT	Automatically marks mentor slots as booked, stores booking ownership details, and increments mentor session statistics whenever mentor bookings are created.
trg_mentor_bookings_au_slot	AFTER UPDATE	Automatically reopens mentor slots and clears booking ownership information whenever mentor bookings are cancelled.

7.List of Procedures:

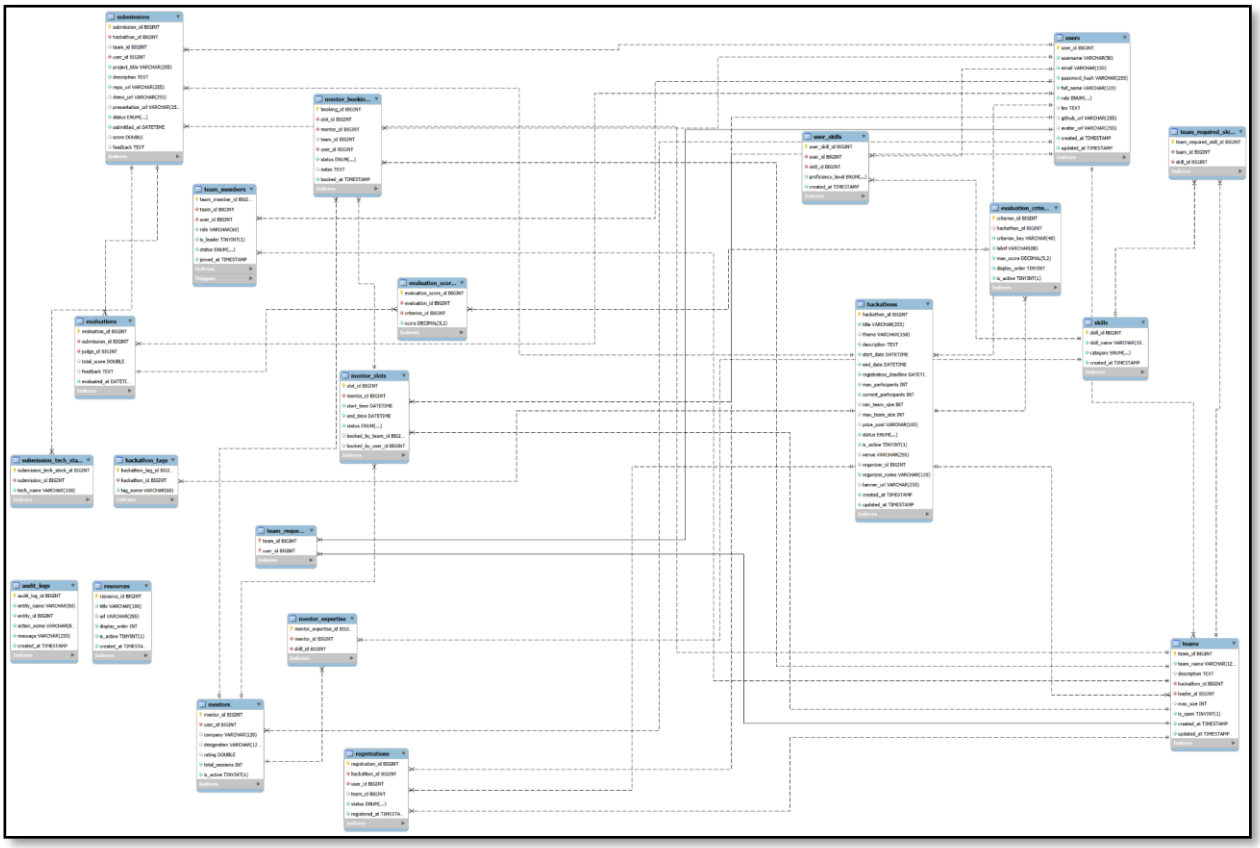

Procedure	Detailed Purpose
`sp_register_for_hackathon`	Handles user registration into hackathons by inserting new registration records and automatically updating existing registrations when the same user is already registered for the target hackathon.
`sp_create_team`	Handles complete hackathon team creation by creating a team record, determining valid team size, automatically adding the creator as the team leader inside `team_members`, and returning the generated team ID.
`sp_join_team`	Handles team joining operations by adding users into teams, assigning roles, activating memberships, and automatically updating existing membership records if the user already belongs to the team.
`sp_submit_project`	Handles complete project submission workflow by creating submission records, storing project metadata and repository/demo links, processing JSON-based technology stacks, and inserting technologies into the submission tech stack table.
`sp_record_evaluation`	Handles complete judging and evaluation workflow by creating/updating evaluation records, storing judge feedback, mapping criterion-wise scores, and updating existing evaluation scores when judges modify evaluations.
`sp_book_mentor_slot`	Handles mentor slot booking operations by creating mentor booking records while relying on triggers for mentor assignment, slot validation, booking synchronization, and mentor session tracking.
`sp_get_leaderboard`	Retrieves ranked leaderboard information from the leaderboard view and supports both hackathon-specific and global leaderboard retrieval using optional filtering logic.
`sp_get_user_dashboard`	Retrieves dashboard-related information of a specific user from the user dashboard view using the provided user ID.

sp_find_open_teams_for_skills	Finds open hackathon teams matching specific skills by processing JSON-based skill lists, matching them against required team skills, and returning filtered open teams ordered by team size and name.
sp_refresh_hackathon_statuses	Automatically refreshes and updates hackathon lifecycle statuses based on registration deadlines, start dates, end dates, and current system time using conditional CASE-based logic.

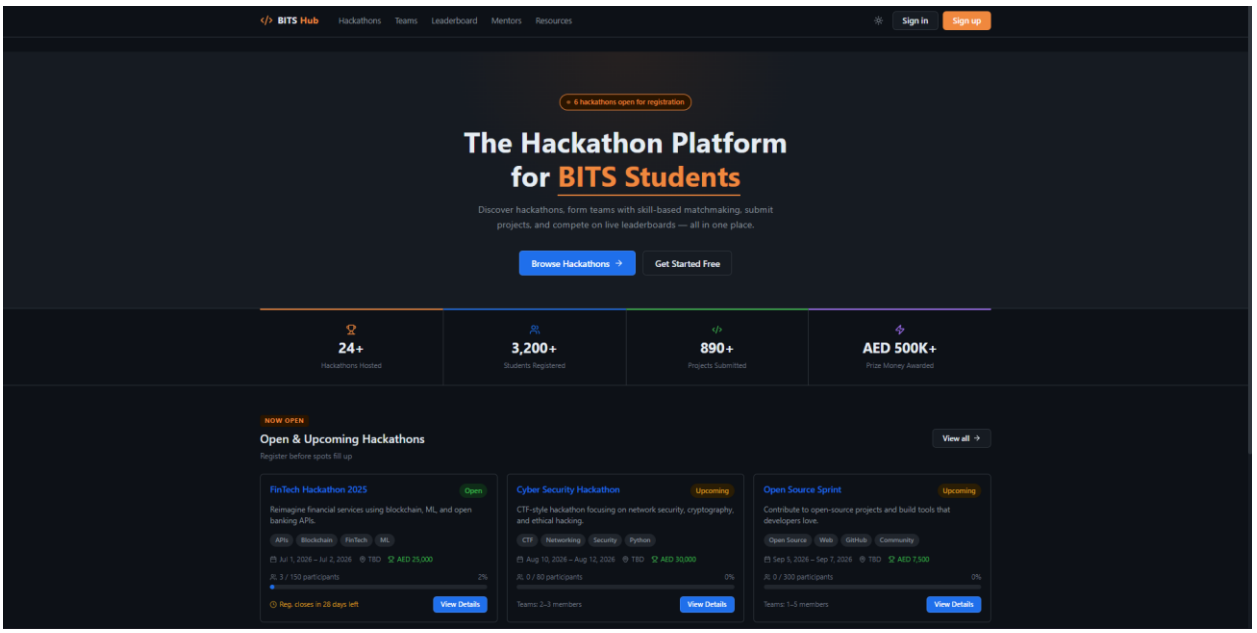

8.List of Views:

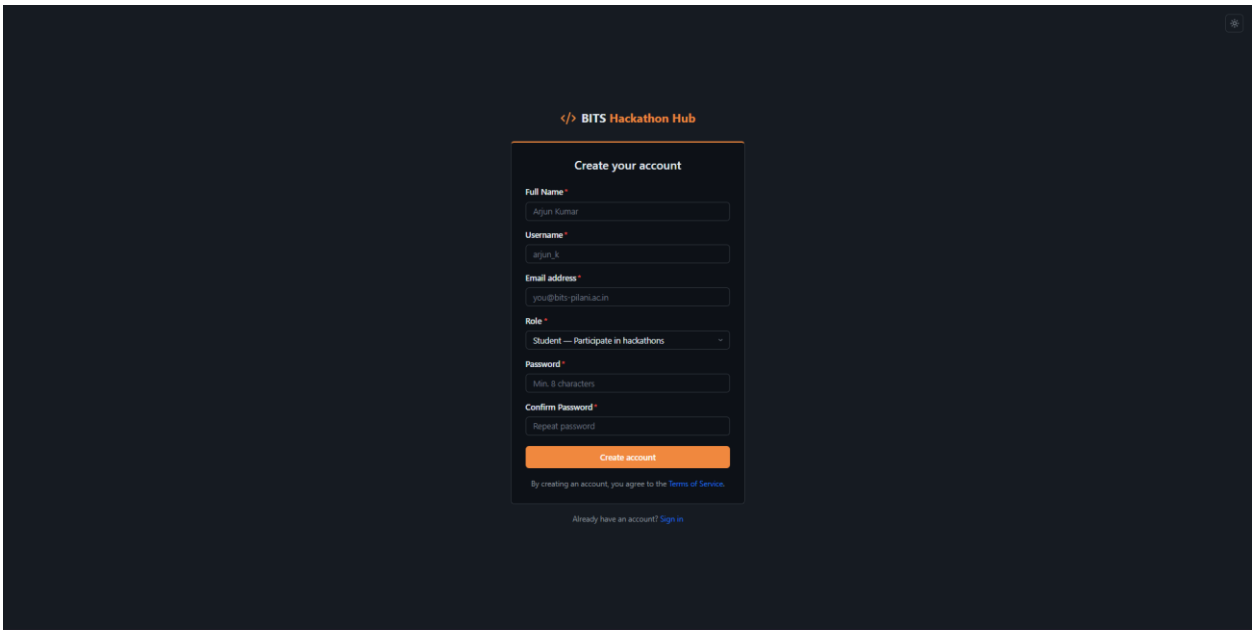

View	Detailed Purpose
vw_hackathon_cards	Provides frontend-friendly hackathon card information by combining hackathon details and aggregated hackathon tags into a single reusable virtual table for dashboard and listing screens.
vw_team_cards	Provides frontend-friendly team card information by combining team details, leader information, hackathon details, active member counts, and aggregated required skills into a single reusable virtual table.
vw_leaderboard	Generates ranked leaderboard information for evaluated submissions by calculating per-hackathon rankings, handling score tie-breakers, and combining submission, team, and user information into a reusable leaderboard dataset.
vw_mentor_cards	Provides frontend-friendly mentor card information by combining mentor profiles, expertise areas, ratings, session statistics, and counts of available mentoring slots into a single reusable virtual table.
vw_resource_cards	Provides frontend-ready active resource information including titles, URLs, and display ordering for learning/resource sections of the platform.
vw_user_dashboard	Provides summarized user dashboard statistics by combining user profile information with counts of registrations, active teams, submissions, and mentor bookings into a reusable dashboard dataset.
